

Setting Up observer-agent-mvp on Windows

This guide shows how to get the project running end-to-end:

1. Create and activate a virtual environment.
2. Patch `bootstrap.py` for Windows.
3. Install dependencies.
4. Adjust `auto.py` invocations to use the `venv` interpreter.
5. Ensure the `recall` module finds `config.py`.
6. Fix console-script entry points and add `main()`.

1. Virtual Environment

```
python -m venv .venv
.\.venv\Scripts\Activate.bat
```

2. Patch `bootstrap.py`

In the `setup(...)` call, change:

```
packages=find_packages(),
entry_points={
    'console_scripts': [
        'screen-recorder=recording:main',
    ],
},
```

to:

```
packages=find_packages() + ['scripts'],
entry_points={
    'console_scripts': [
        'screen-recorder=scripts.recording:main',
    ],
},
```

Also, create an empty file:

```
scripts/__init__.py
```

3. Install Requirements

```
pip install -r requirements.txt
```

4. Update `auto.py`

At the top, add `import sys`. Replace every

```
subprocess.run(['python3', script_path])
```

with

```
subprocess.run([sys.executable, script_path], check=True)
```

and similarly adjust any

```
cmd = ['python3', script_path, ...]
```

to

```
cmd = [sys.executable, script_path, ...]
```

5. Running the recall Module

Always invoke from the project root so that `config.py` is on the path:

```
python -m scripts.recall
```

6. Bootstrap & Recording Fix

After installing via:

```
python bootstrap.py install
```

you will be prompted:

```
Would you like to run the screen recorder now? (y/N):
```

To have `scripts/recording.py` export a `main()` for the console-script, add at the bottom of `recording.py`:

```
def main():
    """Console-script entry point."""
    start_screen_recording()

if __name__ == "__main__":
    main()
```

Reinstall to pick up the change:

```
python bootstrap.py install
```

Now:

```
screen-recorder
```

will launch the recorder immediately after you press `y`.
